Eye Contact: Not Available

Skin Contact: Not Available

Skin Sensitization: Not Available

Phosphoric Acid: Animal testing indicates that Phosphoric Acid is corrosive to the eye and skin. It has not been tested for skin sensitization. Single exposure by ingestion to high doses of Phosphoric Acid caused gastrointestinal irritation and hemorrhage. No animal data are available to define the carcinogenicity, developmental or reproductive hazards of Phosphoric Acid. Phosphoric Acid has not produced genetic toxicity in mammalian cell cultures or in animals.

Glycolic Acid: 70% Glycolic Acid is a skin and eye corrosive. Glycolic Acid is not a skin sensitizer in animals. Toxic effects described in animals from single exposure to Glycolic Acid by inhalation include body weight losses and ocular and nasal discharges. Histopathological changes observed include laryngeal ulceration, nasal lesions, and lung inflammation. Repeated exposures produced liver, spleen, thymus, and gastrointestinal tract effects. Administration of single high oral doses of Glycolic Acid produced gastrointestinal tract irritation, liver damage, increased kidney weights and the formation of calcium oxalate crystals in the kidneys. Repeated oral doses in cats produced mortality, weight and appetite loss, depression, vomiting, coma, convulsions, and kidney failure.

Dogs given similar and higher doses exhibited no toxic effects. Repeated oral dosing in rats resulted in excessive mortality, decreased body weight and hematologic and clinical chemistry changes. The primary target organ of toxicity was the kidney. Both organ weight and microscopic changes were seen in kidneys of male rats. No systemic toxicity occurred in female rats. There was no evidence of neurotoxic or immunologic effects with Glycolic Acid from this test.

No animal test reports are available to define carcinogenic hazards. At high dietary levels in animals, developmental toxicity occurred only at exposure levels producing other toxic effects in the adult animal. Glycolic Acid is not considered a unique developmental hazard to the conceptus. The compound does not produce genetic damage in bacterial cell cultures. It has not produced genetic damage in tests on animals. There was no evidence of reproductive effects in rats.

Nonylphenoxy Polyethoxyethanol: The compound is not a skin irritant, is a mild eye irritant, and is untested for animal sensitization.

There is little additional information. A closely related material (nonyl phenol plus 30 moles ethylene oxide) produced no adverse effects when fed to rats at levels up to 5,000 mg/kg/day for 90 days.

No animal test reports are available to define carcinogenic, mutagenic, developmental, or reproductive hazards.

Tests in animals on a closely related material (nonyl phenol plus 30 moles ethylene oxide) demonstrate no developmental toxicity.

Lauryldimethyl Amine Oxide: Lauryldimethyl Amine Oxide is not a mutagen. Cell transformation was not induced. No increase in hepatic neoplasms observed above control group in high-dose exposure group at 100 ppm.
