**Sodium Hypochlorite:** The concentrated solution is corrosive to the skin, and a 5% solution is a severe eye irritant, but the compound is untested for animal sensitization. Solutions containing more than 5% available chlorine are classified as DOT corrosive.  
Ingestion: Toxicity described in animals caused an increase in the relative weight of adrenal glands in one study, but no pathological changes were observed in two other studies. Long-term administration of the compound in drinking water of rats caused depression of the immune system.  
Skin: No adverse changes were observed in an eight week dermal study of an 1% solution in guinea pigs.  
Tests on animals demonstrate no carcinogenic activity by either oral or dermal routes. Tests in bacterial and mammalian cell cultures demonstrate mutagenic activity. No animal test reports are available to define developmental or reproductive hazards.
